Mexican Fan Palm *Washingtonia Robusta*

The Mexican Fan palm is native to western Sonora and Baja California Sur in NW Mexico. It naturalizes readily and is the most common Washingtonia form seen along the highways and in the brushlines of south Texas. This palm is grown as an ornamental tree and the longevity may exceed 500 years. It can produce up to 50 fronds each year. Once a tree has reached about 30 feet in height, it will drop any old leaves or leaf bases remaining, giving it a smooth trunk. The trunk is grayish in color.

AT A GLANCE	
Height	70'-100'
Width	6'-8'
Origin	Mexico
Drought Tolerance	High
Growth Rate	Fast
Salt Tolerance	Moderate
USDA Zone(s)	9b-11
